Dyson Dyson

Question 1

Let $(x_i)_1^n$ be a finite sequence of positive numbers with mean m . Recall that $\log t \geq 1 - \frac{1}{t}$. Then

$$\begin{aligned}\frac{1}{n} \sum_{i=1}^n x_i \log x_i &\geq \frac{1}{n} \sum_{i=1}^n x_i \left(1 - \frac{1}{x_i}\right) \\&= \frac{1}{n} \sum_{i=1}^n (x_i - 1) \\&= \frac{1}{n} \sum_{i=1}^n x_i - \frac{1}{n} \sum_{i=1}^n 1 \\&= m - \frac{n}{n} \\&= m - 1 \\&= m \left(1 - \frac{1}{m}\right) \\&\leq m \log m\end{aligned}$$

This is obviously not correct, so I'll try a special case of $m = 1$. Then

$$\begin{aligned}\frac{1}{n} \sum_{i=1}^n x_i \log x_i &\geq \cdots \\&= m - \frac{n}{n} \\&= 1 - 1 \\&\therefore \frac{1}{n} \sum_{i=1}^n x_i \log x_i \geq 0\end{aligned}$$

Also $m \log m = 1 \log 1 = 0$. Therefore $\frac{1}{n} \sum_{i=1}^n x_i \log x_i \geq m \log m$ when $m = 1$, as required.

Question 2

Let $f(u) = \frac{u^m}{e^u}$ for some positive integer m . Then $\frac{df}{du} = \frac{mu^{m-1}e^u - u^m e^u}{e^{2u}} = \frac{u^{m-1}(m-u)}{e^u}$.

Consider $u > m > 0$. Then $f(u)$ is positive, since u^m and e^u are both positive. And $f'(u)$ is negative, since u^{m-1} and e^m are positive, but $m-u$ is negative. So for sufficiently large u , the function is always positive but its derivative is always negative. Therefore when $u > m$, f is a strictly decreasing function bounded below by 0, so $\lim_{u \rightarrow \infty} \frac{u^m}{e^u} = 0$ for all m .

Question 3

We want to prove that $\lim_{x \rightarrow 0^+} \log x = -\infty$. That means for all $M > 0$, there exists x such that $\log x < -M$. We can just choose any positive $x < e^{-M}$. Since \exp is a positive, strictly increasing function, e^{-M} will always be positive and will approach 0 as M grows. So $x \rightarrow 0^+$ as $M \rightarrow \infty$. Therefore $\lim_{x \rightarrow 0^+} \log x = -\infty$ as required.

Let $u = -\log x$. Then as $x \rightarrow 0^+$, $u \rightarrow \infty$.

Also $\frac{1}{e^u} = e^{\log x} = x$ so $\frac{u}{e^u} = -x \log x$. Therefore

$$\lim_{x \rightarrow 0^+} (x \log x) = - \lim_{u \rightarrow \infty} \frac{u}{e^u} = -0$$

by Question 2. Therefore $\lim_{x \rightarrow 0^+} (x \log x) = 0$ as required.

Note that $x^x = e^{x \log x}$, so

$$\lim_{x \rightarrow 0^+} x^x = \lim_{x \rightarrow 0^+} e^{x \log x} = e^{\lim_{x \rightarrow 0^+} (x \log x)} = e^0 = 1$$
